#### <span id="page-2-0"></span>Indices

- $\blacksquare$  Set of dams  ${\cal I}$
- Set of rivers  $\mathcal{E} \subset \mathcal{I} \times \mathcal{I}$ :  $(i, j) \in \mathcal{E} \Longleftrightarrow$  river flows from dam i to dam j. Set of time intervals:  $\{1, ..., T\}$ .

### Optimization variables

- $q_{i,t}$ : water level of dam i at the beginning of time interval  $t \in \{1, ..., T + 1\}$
- $x_{i,t}$ : amount of water exploited at dam  $i$  during time interval  $t \in \{1, ..., T\}$
- $y_{(i,j),t}$ : amount of water transported over the river  $\left( i,j \right)$ during the time interval  $t \in \{1, ..., T\}$
- $z_{i,t}$ : amount of water exploited at dam *i* during the time int[e](#page-0-0)[r](#page-1-0)v[a](#page-0-0)l  $t \in \{1, ..., T\}$  $t \in \{1, ..., T\}$  $t \in \{1, ..., T\}$ , not transported [to](#page-1-0) [an](#page-3-0)[y](#page-1-0) [o](#page-2-0)[th](#page-3-0)er [d](#page-8-0)a[m](#page-1-0).

#### <span id="page-3-0"></span>**Parameters**

- $P_{i,t}$ : precipitation at *i*, during the time interval *t*
- $Q_i$ : storage capacity of dam i
- $K_i$ : initial level of dam *i*
- $D_t$ : electricity demand during the time interval t

### Functions

- $f_i \colon x \mapsto f_i(x)$ : exploitation cost on a given time interval at dam  $i$ , as a function of the amount of exploited water  $x$ .
- $g_i\colon x\mapsto g_i(x)$ : electricity production as a function of the amount of exploited water at dam i.

#### <span id="page-4-0"></span>Cost function

$$
\min_{q,x,y,z} \sum_{t=1}^T \sum_{i \in I} f_i(x_{i,t}).
$$

#### **Constraints**

Nonnegativity of the variables:

$$
q_{i,t} \geq 0
$$
,  $x_{i,t} \geq 0$ ,  $y_{(i,j),t} \geq 0$ ,  $z_{i,t} \geq 0$ .

**Bounds:** 

$$
q_{i,t} \leq Q_i, \quad \forall t \in \{1, ..., T+1\}.
$$

Initial condition:

$$
q_{1,i}=K_i.
$$

K ロ ▶ K 個 ▶ K 할 ▶ K 할 ▶ 이 할 → 9 Q Q →

<span id="page-5-0"></span>**Demand satisfaction:** 

$$
\sum_{i\in\mathcal{I}}g_i(x_{i,t})=D_t,\quad\forall t\in\{1,...,T\}.
$$

Evolution of the water level in each dam:

$$
q_{i,t+1} = q_{i,t} + P_{i,t} - x_{i,t} + \sum_{\substack{j \in \mathcal{I} \\ (j,i) \in \mathcal{E}}} y_{(j,i),t}, \quad \forall t \in \{1, ..., T\}.
$$

Amount of exploited water:

$$
x_{i,t} = \sum_{\substack{j \in \mathcal{I} \\ (i,j) \in \mathcal{I}}} y_{(i,j),t} + z_{i,t}, \quad \forall t \in \{1, ..., T\}.
$$

#### <span id="page-6-0"></span>Dynamic programming.

We parametrize the problem by

- $\blacksquare$  the initial time interval t
- the initial level of water in every dam  $\pmb{q} \in \mathbb{R}^{\mathcal{I}}.$

**KORKARYKERKER POLO** 

Let  $V(t, q)$  denote the corresponding optimal cost.

We have  $V(T + 1, q) = 0$ .

#### <span id="page-7-0"></span>Dynamic programming principle

Let  $t \in \{1, ..., T\}$  and let  $q \in \prod_{i \in \mathcal{I}}[0, Q_i]$ . Then

$$
V(t,q) = \inf_{\substack{q' \in \mathbb{R}^{\mathcal{I}}, \, x \in \mathbb{R}^{\mathcal{I}} \\ y \in \mathbb{R}^{\mathcal{E}}, \, z \in \mathbb{R}^{\mathcal{I}}}} \Big( \sum_{i \in \mathcal{I}} f_i(x_i) \Big) + V(t+1,q'), \qquad (DP(t,q))
$$

subject to:

- Non-negativity:  $q'_i \ge 0$ ,  $x_i \ge 0$ ,  $y_{(i,j)} \ge 0$ ,  $z_i \ge 0$ .
- Bounds:  $q'_i \leq Q_i$ .
- Demand:  $\sum_{i \in \mathcal{I}} g_i(x_i) = D_t$ .
- Conservation:  $q'_i = q_i + P_{i,t} x_i + \sum_j y_{(j,i)}.$ j∈I (j,i)∈E

■ Exploration : 
$$
x_i = \sum_{\substack{j \in \mathcal{I} \\ (i,j) \in \mathcal{I}}} y_{(i,j)} + z_i.
$$

<span id="page-8-0"></span>Remarks.

■ Why does it work?

 $\rightarrow$  The level of water in the dams at time t is a sufficient information to take optimal decisions from t until the end of the optimization process.

 $\rightarrow$  Knowing the level of water in the dams at time t, one can completely **forget** what happened in the past.

- **The dynamic programming principle characterizes** globally optimal solutions, even if the original problem is non convex.
- $\blacksquare$  In the practical implementation of the method, one needs to discretize the variable  $q$ . The number of discretizetion points grows exponentially with the number of dams. This phenomenon is called curse of dimensionality.
