◇ **Main goal**

The objective of RBM is to find **very quickly accurate approximations** of parameter-dependent functions of the generic form

$$u : \Omega \times \mathcal{G} \rightarrow \mathbb{R},$$

- $\Omega \in \mathbb{R}^d$: the spatial domain,
- $\mathcal{G} \subset \mathbb{R}^{N_p}$: the parameter domain, with N_p the number of parameters.
 $\mu = (\mu_1, \dots, \mu_{N_p}) \in \mathcal{G}$: the varying parameter.

$$\begin{aligned} \mathcal{L}(\mu)(u(\mu)) &= F(\mu), \text{ in } \Omega, \\ &+ \text{ boundary conditions on } \partial\Omega. \end{aligned}$$

Reduced Basis Methods (RBM)

PDE : $\mu \rightarrow u(\mu)$

$\mu \in \mathcal{G}$: Parameter

$u(\mu)$: Solution

$$\begin{cases} -\nabla \cdot (a(\mu)\nabla u) = f(\mu) & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega. \end{cases}$$

Reduced Basis Methods (RBM)

$$PDE : \boldsymbol{\mu} \rightarrow u(\boldsymbol{\mu})$$

$\boldsymbol{\mu} \in \mathcal{G}$: Parameter

$$u_h(\boldsymbol{\mu}; \mathbf{x}) = \sum_{i=1}^{\mathcal{N}} u_i(\boldsymbol{\mu}) w_i(\mathbf{x}),$$

$$\left\{ \begin{array}{l} \text{where } \mathbf{u}(\boldsymbol{\mu}) = (u_1(\boldsymbol{\mu}), \dots, u_{\mathcal{N}}(\boldsymbol{\mu}))^T \in \mathbb{R}^{\mathcal{N}} \\ \text{is the solution of a linear system} \\ \mathbf{A}(\boldsymbol{\mu})\mathbf{u}(\boldsymbol{\mu}) = \mathbf{f}(\boldsymbol{\mu}). \end{array} \right.$$

Convergence of the finite element method

Provided that “sufficiently uniform” meshes are used and \mathbb{P}_1 FE,

$$\|u_h - u\|_{H^1} = \mathcal{O}(h),$$

where h denotes the mesh size.

Reduced Basis Methods (RBM)

$$PDE : \mu \rightarrow u(\mu)$$

$\mu \in \mathcal{G}$: Parameter

$$u_h(\mu; \mathbf{x}) = \sum_{i=1}^{\mathcal{N}} u_i(\mu) w_i(\mathbf{x}),$$

$$\left\{ \begin{array}{l} \text{where } \mathbf{u}(\mu) = (u_1(\mu), \dots, u_{\mathcal{N}}(\mu))^T \in \mathbb{R}^{\mathcal{N}} \\ \text{is the solution of a linear system} \\ \mathbf{A}(\mu)\mathbf{u}(\mu) = \mathbf{f}(\mu). \end{array} \right.$$

Aim of the reduced basis methods (RBM)

Solve the PDE as quickly as possible when it has to be evaluated for many parameter values

Applications

Real-time simulations

Parametric studies

...

Reduced Basis Methods (RBM)

PDE : $\mu \rightarrow u(\mu)$

$\mu \in \mathcal{G}$: Parameter

$$u_h(\mu; \mathbf{x}) = \sum_{i=1}^N u_i(\mu) w_i(\mathbf{x}),$$

where $\mathbf{u}(\mu) = (u_1(\mu), \dots, u_N(\mu))^T \in \mathbb{R}^N$
is the solution of a linear system
 $\mathbf{A}(\mu)\mathbf{u}(\mu) = \mathbf{f}(\mu)$.

Solution manifold

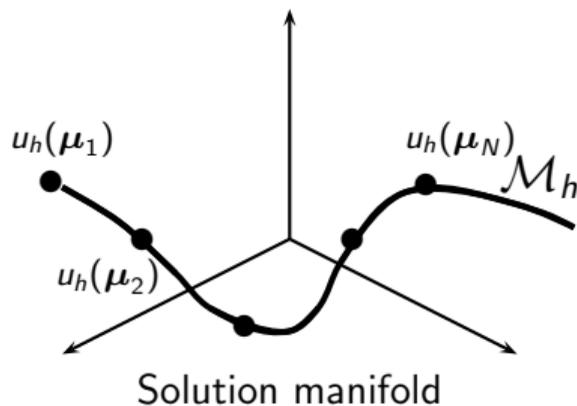

Solution manifold: $\mathcal{M} = \{u(\mu) \mid \mu \in \mathcal{G}\}$

HF solution manifold: $\mathcal{M}_h = \{u_h(\mu) \mid \mu \in \mathcal{G}\}$

How can we reduce the manifold complexity?

$$\exists, \tau, C > 0, \forall N > 1, \quad d_N(\mathcal{M}, V) \leq Ce^{-\tau N}$$

Reduced Basis Methods (RBM)

Solution manifold

Solution manifold: $\mathcal{M} = \{u(\mu) \mid \mu \in \mathcal{G}\}$

HF solution manifold: $\mathcal{M}_h = \{u_h(\mu) \mid \mu \in \mathcal{G}\}$

Reduced space

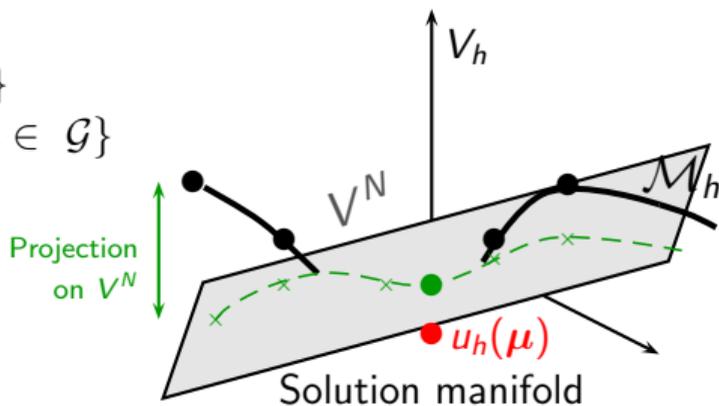

V^N Reduced space

Projection on V^N :

$$\inf_{v_N \in V^N} \|u_h - v_N\|_{V_h}.$$

Kolmogorov N-width = error from the **linear** space that best fit the solution manifold:

$$d_N(\mathcal{M}_h, V_h) = \inf_{\substack{V^N \subset V_h \\ \dim(V^N)=N}} \sup_{u_h \in \mathcal{M}_h} \inf_{v_N \in V^N} \|u_h - v_N\|_{V_h}.$$

Exponential decay

$$\exists, \tau, C > 0, \forall N > 1, \quad d_N(\mathcal{M}, V) \leq Ce^{-\tau N}$$

Reduced Basis Methods

- ◇ **Offline** Construction of a reduced space V_N spanned by a reduced basis.
- ◇ **Online** Computation of the reduced coefficients α .

The optimal reduced space V^N may not be found

Two main algorithms to find approximated reduced spaces: **the Proper Orthogonal Decomposition (POD)** or **greedy algorithms**.

Reduced basis Galerkin approximation

Assume the weak formulation of the HF problem yields the discretized system

$$\mathbf{A}(\boldsymbol{\mu})\mathbf{u}(\boldsymbol{\mu}) = \mathbf{l}(\boldsymbol{\mu})$$

then

$$a(u_N(\boldsymbol{\mu}), v_N; \boldsymbol{\mu}) = \ell(v_N; \boldsymbol{\mu})$$

gives a new system to solve:

$$\boxed{\mathbf{P}^T \mathbf{A}(\boldsymbol{\mu}) \mathbf{P} \boldsymbol{\alpha}(\boldsymbol{\mu}) = \mathbf{P}^T \mathbf{l}(\boldsymbol{\mu})}, \quad (\text{G-RB})$$

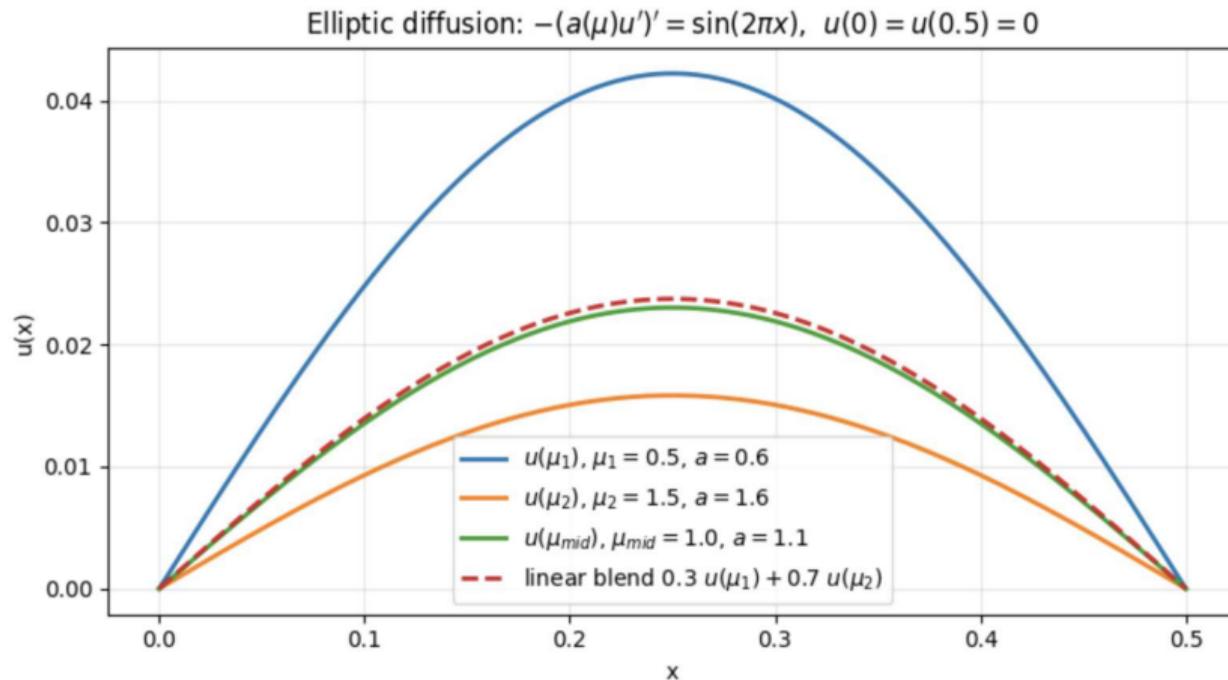

where $\mathbf{P} \in \mathbb{R}^{N \times N}$. Now, we get a system where the inversion cost is in $\mathcal{O}(N^3)$ since dimensions : $\mathbf{P}^T \mathbf{A}(\boldsymbol{\mu}) \mathbf{P} \in \mathbb{R}^{N \times N}$ and $\mathbf{P}^T \mathbf{l} \in \mathbb{R}^N$!

Reduced basis Galerkin approximation

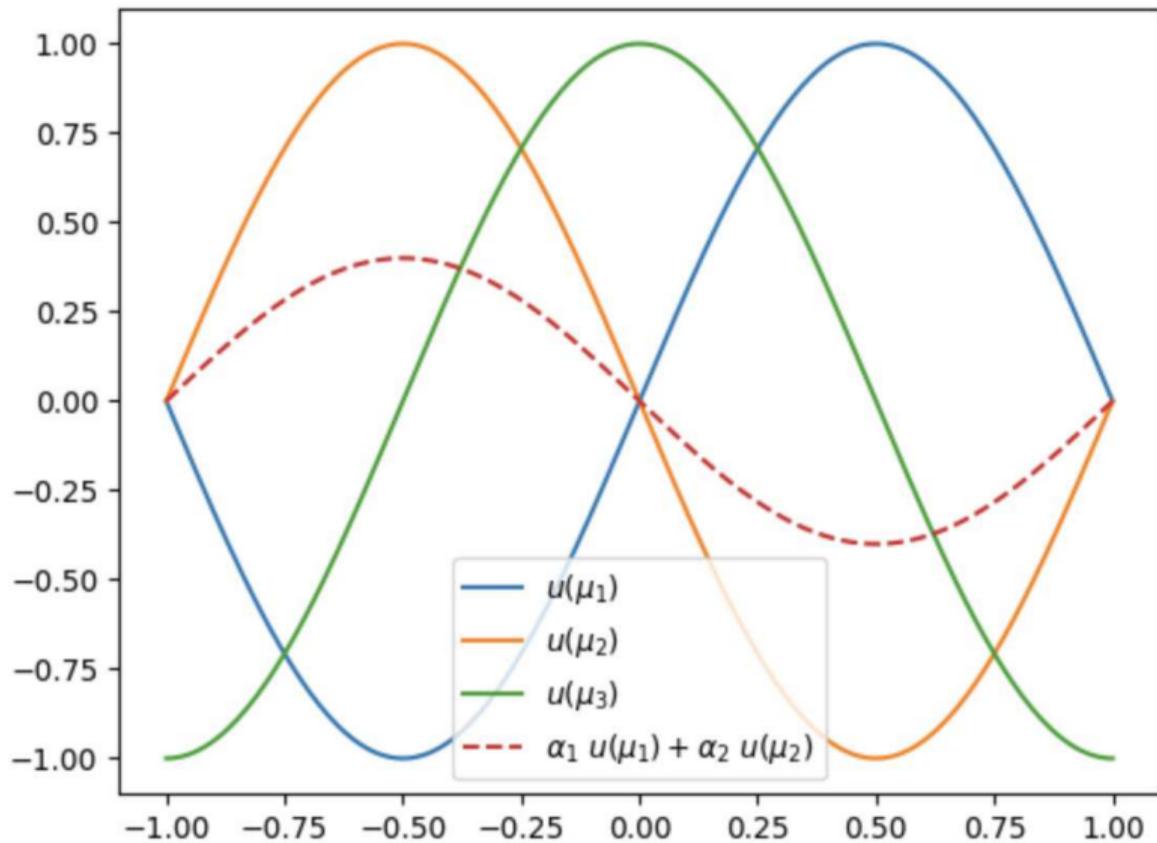

Assembling cost with the affine operators:
 $\mathcal{O}(N^2Q^a + NQ')$ with

$$\mathbf{P}^T \mathbf{A}(\boldsymbol{\mu}) \mathbf{P} = \sum_{q=1}^{Q^a} \theta_q^a(\boldsymbol{\mu}) \underbrace{\mathbf{P}^T \mathbf{A}_q \mathbf{P}}_{\text{precomputed offline}}, \quad \mathbf{P}^T \mathbf{I}(\boldsymbol{\mu}) = \sum_{q=1}^{Q'} \theta_q^I(\boldsymbol{\mu}) \underbrace{\mathbf{P}^T \mathbf{I}_q}_{\text{precomputed offline}}.$$

POD: Continuous version

POD: Continuous version

POD: Continuous version

How many snapshots do we need to represent our data?

POD: Continuous version

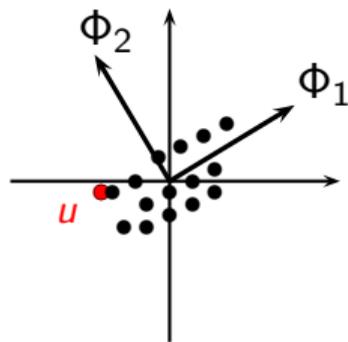

Suppose we need M snapshots, the POD compresses our data by using $N \leq M$ basis functions!

POD: Continuous version

We want to approximate $u(\mathbf{x}, \boldsymbol{\mu})$ by $\sum_{k=1}^N a_k(\boldsymbol{\mu}) \Phi_k(\mathbf{x})$.

Let us consider $\boldsymbol{\mu}$ a random variable and u centered ($\mathbb{E}_{\boldsymbol{\mu}}[u] = 0$).

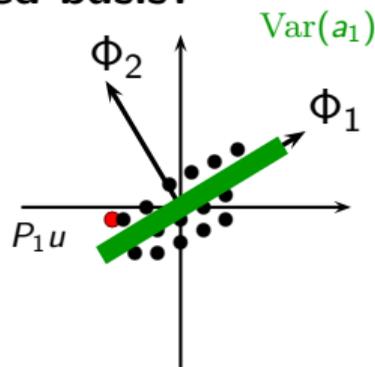

POD = PCA: We want to find the axes that best represent the data!

$$\min_{\|\Phi_i\|=1} \mathbb{E}[\|u - \sum_{k=1}^N a_k(\boldsymbol{\mu}) \Phi_k\|^2].$$

POD: Continuous version

How do we find the reduced basis?

$$\text{Var}(a_1) = \mathbb{E}[a_1^2] - (\mathbb{E}[a_1])^2 = \mathbb{E}[a_1^2]$$

$$a_1 = (u, \Phi_1), \quad \|\Phi_1\| = 1.$$

$$\min_{\|\Phi_1\|=1} \mathbb{E}[\|u - (u, \Phi_1)\Phi_1\|^2] \text{ or } \max_{\|\Phi_1\|=1} \mathbb{E}[|(u, \Phi_1)|^2] \text{ or } C\Phi_1 = \lambda_1\Phi_1$$

Spectral theorem (Compact Self-Adjoint Operator)

Let V be a separable Hilbert space and let $C : V \rightarrow V$ be a compact, positive, self-adjoint operator. Then there exists an orthonormal basis $\{\Phi_n\}_{n \in \mathbb{N}}$ of V and a sequence of real positive numbers $(\lambda_n)_{n \in \mathbb{N}}$ such that, for all $n \in \mathbb{N}$,

$$C\Phi_n = \lambda_n\Phi_n.$$

Moreover, $\lim_{n \rightarrow \infty} \lambda_n = 0$.

$$\mathbb{E}[(u, \Phi)u] = \lambda\Phi, \text{ i. e. } C\Phi = \lambda\Phi.$$

One can prove that C is a positive linear compact self-adjoint operator: one unique solution equal to the largest eigenvalue of the problem!

$$(C\Phi, \Phi) = \mathbb{E}[|(u, \Phi)|^2] = \lambda$$

$$\max_{\|\Phi_1\|=1} \mathbb{E}[|(u, \Phi_1)|^2] = \lambda_1$$

$$\lambda_1 \geq \lambda_2 \geq \dots \geq 0$$

$$\mathbb{E}[\|u - P_N u\|^2] = \sum_{k>N} \mathbb{E}[a_k^2] = \sum_{k>N} \lambda_k$$

In fact, one can show that the more regularizing the operator C is, the faster its eigenvalues decay!

Link between regularity and eigenvalues

One can show that the more regularizing the operator C is, the faster its eigenvalues decay!

Exercise

Let $A : L^2(0, 1) \rightarrow L^2(0, 1)$ be defined by $(Ax)(t) = \int_0^t x(s) ds$.

1. Determine the adjoint operator A^* .
2. Define $C = A^*A$. Show that C is a compact, positive, and self-adjoint operator on $L^2(0, 1)$.
3. Let σ denote a singular value of A , and let $x \neq 0$ satisfy $Cx = A^*Ax = \sigma^2x$.
 - (a) Show that A^*Ax is twice differentiable and compute $(A^*Ax)''(t)$.
 - (b) Deduce that x satisfies the differential equation $x(t) + \sigma^2x''(t) = 0$.
4. Using the appropriate boundary conditions, determine the general form of the eigenfunctions $x(t)$.
5. Deduce the explicit expression of the singular values σ_n of A and determine their asymptotic behaviour as $n \rightarrow \infty$.

Link between regularity and eigenvalues

Solution

Let $A : L^2(0, 1) \rightarrow L^2(0, 1)$ be defined by $(Ax)(t) = \int_0^t x(s) ds$.

1. Adjoint A^* . For $x, y \in L^2(0, 1)$,

$$(Ax, y) = \int_0^1 \left(\int_0^t x(s) ds \right) y(t) dt = \int_0^1 x(s) \left(\int_s^1 y(t) dt \right) ds = (x, A^*y),$$

2.

Self-adjointness: $C = A^*A$ is self-adjoint since $(A^*A)^* = A^*(A^*)^* = A^*A$.

Positivity: $(Cx, x) = (A^*Ax, x) = (Ax, Ax) = \|Ax\|_{L^2}^2 \geq 0$.

Compactness: A maps $L^2(0, 1)$ continuously into $H^1(0, 1)$, since $Ax \in H^1(0, 1)$ and

$$(Ax)' = x \quad \text{in } L^2(0, 1), \quad \|Ax\|_{H^1}^2 = \|Ax\|_{L^2}^2 + \|x\|_{L^2}^2 \leq C\|x\|_{L^2}^2.$$

The embedding $H^1(0, 1) \hookrightarrow L^2(0, 1)$ is compact (Rellich), hence A is compact and consequently $C = A^*A$ is compact.

Link between regularity and eigenvalues

Solution

3. Spectral problem. Let σ be a singular value of A and let $x \neq 0$ satisfy $Cx = A^*Ax = \sigma^2x$.

Set $y = A^*Ax$. Since $(A^*y)(t) = \int_t^1 y(s) ds$, $(A^*y)'(t) = -y(t)$ (p.p).

Hence $(A^*Ax)'(t) = -(Ax)(t)$ (p.p), $(A^*Ax)''(t) = -x(t)$

On the other hand, $A^*Ax = \sigma^2x$ implies $(A^*Ax)'' = \sigma^2x''$, thus $\sigma^2x''(t) = -x(t) \iff x(t) + \sigma^2x''(t) = 0$.

Boundary conditions. From $A^*Ax = \sigma^2x$:

at $t = 1$, $(A^*Ax)(1) = \int_1^1 (Ax)(s) ds = 0 = \sigma^2x(1) \implies x(1) = 0$. Also, $(A^*Ax)'(0) = -(Ax)(0) = 0 = \sigma^2x'(0) \implies x'(0) = 0$.

4. Eigenfunctions. Let $\omega = \sigma^{-1}$. The ODE becomes $x'' + \omega^2x = 0$, so $x(t) = A \cos(\omega t) + B \sin(\omega t)$. The condition $x'(0) = 0$ gives $B = 0$. Then $x(1) = 0$ yields $A \cos(\omega) = 0 \iff \omega = \frac{\pi}{2} + n\pi$, $n \in \mathbb{N}$. Thus the (normalized) eigenfunctions are

$$x_n(t) = A \cos\left(\left(n + \frac{1}{2}\right)\pi t\right).$$

Link between regularity and eigenvalues

Solution

5. Singular values and asymptotics. Since $\omega_n = \sigma_n^{-1} = \left(n + \frac{1}{2}\right) \pi$, we obtain $\sigma_n = \frac{1}{\left(n + \frac{1}{2}\right) \pi} = \frac{2}{(2n+1)\pi}$, $n \in \mathbb{N}$. Therefore, $\sigma_n \sim \frac{1}{\pi n}$ as $n \rightarrow \infty$. The eigenvalues of $C = A^*A$ are $\mu_n = \sigma_n^2$, hence $\mu_n = \frac{1}{\left(\left(n + \frac{1}{2}\right) \pi\right)^2} = \frac{4}{(2n+1)^2 \pi^2} \sim \frac{1}{\pi^2 n^2}$.

Link between regularity and eigenvalues

One can show that the more regularizing the operator C is, the faster its eigenvalues decay!

Exercise: Transport equation

Let $T_h : L^2(0, 1) \rightarrow L^2(0, 1)$ be the transport operator defined by $(T_h x)(t) = x(t - h)$, with periodic boundary conditions on $(0, 1)$ and a fixed shift $h \in (0, 1)$.

1. Show that T_h is a bounded linear operator on $L^2(0, 1)$ and that $\|T_h x\|_{L^2} = \|x\|_{L^2}$.
2. Compute the adjoint T_h^* and show that $T_h^* = T_{-h}$.
3. Show that $T_h^* T_h = I$, where I is the identity operator.
4. Deduce that the singular values of T_h satisfy $\sigma_n = 1$ for all n .
5. Conclude that T_h is not compact and does not regularize.

Link between regularity and eigenvalues

Thus $\sigma = 1$ No decrease! **No efficient basis functions for transport and advection-dominated regime**

No regularity gain

¹POD_DL_ROM: <https://reducedbasis.github.io/docs/poddlrom/>

Sheep model

Let's get back to our sheep

linear second-order parameter dependent problem

$$\begin{cases} -\nabla \cdot (a(\boldsymbol{\mu})\nabla u) = f(\boldsymbol{\mu}) & \text{dans } \Omega, \\ u = 0 & \text{sur } \partial\Omega. \end{cases}$$

$u(\mathbf{x}; \boldsymbol{\mu}) \in V$: Unknowns,

$\boldsymbol{\mu} \in \mathcal{G}$: Variable parameter,

How do we construct the reduced basis with the POD in practice?

$$\mathbb{E}[(u, \Phi)u] = \lambda\Phi, \text{ i. e. } C\Phi = \lambda\Phi.$$

$\Leftrightarrow \int_{\Omega} R(\mathbf{x}, \mathbf{x}') \Phi(\mathbf{x}') d\mathbf{x}' = \lambda\Phi(\mathbf{x})$, with $R(\mathbf{x}, \mathbf{x}') = \mathbb{E}[u(\mathbf{x})u(\mathbf{x}')]$, which is the spatial continuous covariance operator.

Snapshot POD

The space of the modes is contained into the snapshots' span.

$$R(\mathbf{x}, \mathbf{x}') = \mathbb{E}[u(\mathbf{x})u(\mathbf{x}')] \simeq \frac{1}{N_{train}} \sum_{k=1}^{N_{train}} u(\mathbf{x}, \boldsymbol{\mu}_k)u(\mathbf{x}', \boldsymbol{\mu}_k).$$

$$\mathbb{E}[\underbrace{(u, \Phi)}_a u] = \lambda \Phi, \text{ i. e. } C\Phi = \lambda \Phi.$$

$$\text{so } \frac{1}{N_{train}} \sum_{k=1}^{N_{train}} u(\mathbf{x}, \boldsymbol{\mu}_k) \underbrace{\int_{\Omega} u(\mathbf{x}', \boldsymbol{\mu}_k)\Phi(\mathbf{x}')d\mathbf{x}'}_{a_k=(u(\boldsymbol{\mu}_k), \Phi)} = \lambda \Phi(\mathbf{x}), \quad (\text{R})$$

$$\text{Therefore } \Phi(\mathbf{x}) = \sum_{k=1}^{N_{train}} \alpha_k u(\mathbf{x}, \boldsymbol{\mu}_k).$$

$$a_k = (u(\boldsymbol{\mu}_k), \Phi) = (u(\boldsymbol{\mu}_k), \sum_{j=1}^{N_{train}} \alpha_j u(\boldsymbol{\mu}_j)) = \sum_{j=1}^{N_{train}} \alpha_j \underbrace{(u(\boldsymbol{\mu}_k), u(\boldsymbol{\mu}_j))}_{C_{k,j}}$$

Snapshot POD

The space of the modes is contained into the snapshots' span.

$$R(\mathbf{x}, \mathbf{x}') = \mathbb{E}[u(\mathbf{x})u(\mathbf{x}')] \simeq \frac{1}{N_{train}} \sum_{k=1}^{N_{train}} u(\mathbf{x}, \boldsymbol{\mu}_k)u(\mathbf{x}', \boldsymbol{\mu}_k).$$

$$\mathbb{E}[\underbrace{(u, \Phi)}_a u] = \lambda \Phi, \text{ i. e. } C\Phi = \lambda \Phi.$$

$$\text{so } \frac{1}{N_{train}} \sum_{k=1}^{N_{train}} u(\mathbf{x}, \boldsymbol{\mu}_k) \underbrace{\int_{\Omega} u(\mathbf{x}', \boldsymbol{\mu}_k)\Phi(\mathbf{x}')d\mathbf{x}'}_{a_k=(u(\boldsymbol{\mu}_k), \Phi)} = \lambda \Phi(\mathbf{x}), \quad (\text{R})$$

$$\text{Therefore } \Phi(\mathbf{x}) = \sum_{k=1}^{N_{train}} \alpha_k u(\mathbf{x}, \boldsymbol{\mu}_k).$$

$$a_k = (u(\boldsymbol{\mu}_k), \Phi) = (u(\boldsymbol{\mu}_k), \sum_{j=1}^{N_{train}} \alpha_j u(\boldsymbol{\mu}_j)) = \sum_{j=1}^{N_{train}} \alpha_j \underbrace{(u(\boldsymbol{\mu}_k), u(\boldsymbol{\mu}_j))}_{C_{k,j}}$$

Snapshot POD

$$(R) \Leftrightarrow \frac{1}{N_{train}} \sum_{k=1}^{N_{train}} u(\mathbf{x}, \boldsymbol{\mu}_k) \sum_{j=1}^{N_{train}} \alpha_j \mathbf{C}_{k,j} = \lambda \sum_{k=1}^N \alpha_k u(\mathbf{x}, \boldsymbol{\mu}_k)$$

gives for one $k = i$

$$\frac{1}{N_{train}} \sum_{j=1}^{N_{train}} \mathbf{C}_{i,j} \alpha_j = \lambda \alpha_i.$$

Thus, $\mathbf{C}\alpha = N_{train}\lambda\alpha = \lambda'\alpha$: the eigenvalues of the spatial covariance operator or the snapshot correlation matrix are the same (up to a factor N_{train})!

Discretization

$$\mathbf{C}\alpha = \lambda'\alpha \quad (\text{C})$$

We impose (α_n) orthonormal.

Let $S = [u_1, \dots, u_{N_{train}}] \in \mathbb{R}^{\mathcal{N} \times N_{train}}$. Then $\Phi = S\alpha$, and

$$\|\Phi\|^2 = (S\alpha, S\alpha) = \alpha^T S^T S \alpha$$

But (C) implies that $\|\Phi\|^2 = \lambda'\alpha^T \alpha = \lambda'$

$$\text{Hence } \tilde{\Phi}(\mathbf{x}) = \frac{1}{\sqrt{\lambda'}} \sum_{k=1}^{N_{train}} \alpha_k u(\mathbf{x}, \mu_k) \quad (\text{after normalization})$$

Let us denote in the following slides $\Phi = \tilde{\Phi}$ and $\lambda = \lambda'$.

Discretization: Snapshot POD algorithm

- 1: Collect snapshots $u(\cdot, \mu_i)$, $i = 1, \dots, N_{train}$
- 2: Assemble snapshot matrix S
- 3: Compute correlation matrix $C = S^T S$ or $C = S^T M S$ (M = mass matrix)
- 4: Solve $C\alpha_i = \lambda_i\alpha_i$, $i = 1, \dots, N_{train}$
- 5: Sort the eigenvalues
- 6: Retrieve first N eigenvalues/eigenvectors
- 7: Build POD modes $\Phi_i = \frac{1}{\sqrt{\lambda_i}} S\alpha_i$, $i = 1, \dots, N$

The space of the modes is contained into the snapshots' span: $N \leq N_{train}$

How do we choose N ? $\lambda_1 \geq \lambda_2 \geq \dots \geq 0$

$$\mathbb{E}[\|u - P_N u\|^2] = \sum_{k>N} \mathbb{E}[a_k^2] = \sum_{k>N} \lambda_k$$

Relativ Information Content (RIC) must be close to 0:

$$1 - \sum_{k=1}^N \lambda_k / \sum_{k=1}^{N_{train}} \lambda_k$$

Notations

Mesh (\mathcal{T}) size: h

Sets of edges: $\mathcal{F}, \mathcal{F}_{ext}, \mathcal{F}_{int}, \mathcal{F}_K$

Normals: $\mathbf{n}_K, \mathbf{n}_{K\sigma}, \mathbf{n}_{KL}$

Volumes / Measures/Distances: $|K|, |\sigma|, d_{K\sigma}, d_{L\sigma}, d_{KL}$

Finite Volume Methods

Based on the conservation form of the PDE

Integrate the balance equation on each cell κ and apply Stokes' formula:

$$\sum_{\text{edges of } \kappa} \text{outward flux} = \int_{\kappa} \text{source}.$$

Approximate each flux and write the discrete balance equation obtained.

Notations

Mesh (\mathcal{T}) size: h

Sets of edges: $\mathcal{F}, \mathcal{F}_{ext}, \mathcal{F}_{int}, \mathcal{F}_K$

Normals: $\mathbf{n}_K, \mathbf{n}_{K\sigma}, \mathbf{n}_{KL}$

Volumes / Measures/Distances: $|K|, |\sigma|, d_{K\sigma}, d_{L\sigma}, d_{KL}$

Finite Volume Methods

Based on the conservation form of the PDE \rightarrow Flux: total outward flux = the total internal source

Integrate the balance equation on each cell κ and apply Stokes' formula:

$$\sum_{\text{edges of } \kappa} \text{outward flux} = \int_{\kappa} \text{source}.$$

Approximate each flux and write the discrete balance equation obtained.

Notations

Finite Volume Methods

Based on the conservation form of the PDE \rightarrow Flux: total outward flux = the total internal source

Integrate the equation on each cell κ and apply Stokes' formula:

$$\int_K f(\mathbf{x}) d(\mathbf{x}) = - \int_K \nabla \cdot (a(\boldsymbol{\mu}) \nabla u) = \sum_{\sigma \in \mathcal{F}_K} \underbrace{- \int_{\sigma} a(\boldsymbol{\mu}) \nabla u(\mathbf{x}) \cdot \mathbf{n}_{K,\sigma} d_{\gamma}(\mathbf{x})}_{\bar{F}_{K,\sigma}}$$

Approximate each flux and write the discrete balance equation obtained.

Notations

Mesh (\mathcal{T}) size: h

Sets of edges: $\mathcal{F}, \mathcal{F}_{ext}, \mathcal{F}_{int}, \mathcal{F}_K$

Normals: $\mathbf{n}_K, \mathbf{n}_{K\sigma}, \mathbf{n}_{KL}$

Volumes / Measures/Distances: $|K|, |\sigma|, d_{K\sigma}, d_{L\sigma}, d_{KL}$

Flux balance:

$$\sum_{\sigma \in \mathcal{F}_K} \bar{F}_{K,\sigma} = \int_K f(\mathbf{x}) d(\mathbf{x}).$$

Flux conservativity:

$$\bar{F}_{K,\sigma} + \bar{F}_{L,\sigma} = 0 \text{ if } \sigma = K|L.$$

We want to find $u_h = (u_K)_{K \in \mathcal{T}} \in \mathbb{R}^{\mathcal{T}}$

Define $u_h \rightarrow F_{K,\sigma}(u_h)$ that approximates the flux and find $u_h \in \mathbb{R}^{\mathcal{T}}$ such that

$$|K|f_K = \sum_{\sigma \in \mathcal{F}_K} F_{K,\sigma} \forall K \in \mathcal{T}.$$

We want to find $u_h = (u_K)_{K \in \mathcal{T}} \in \mathbb{R}^{\mathcal{T}}$

Define $u_h \rightarrow F_{K,\sigma}(u_h)$ that approximates the flux and find $u \in \mathbb{R}^{\mathcal{T}}$ such that

$$|K|f_K = \sum_{\sigma \in \mathcal{F}_K} F_{K,\sigma}, \quad \forall K \in \mathcal{T}$$

We want to find $u_h = (u_K)_{K \in \mathcal{T}} \in \mathbb{R}^{\mathcal{T}}$

Define $u_h \rightarrow F_{K,\sigma}(u_h)$ that approximates the flux and find $u \in \mathbb{R}^{\mathcal{T}}$ such that

$$|K|f_K = \sum_{\sigma \in \mathcal{F}_K} F_{K,\sigma}, \quad \forall K \in \mathcal{T}$$

Case of an interior edge

$$\sigma \in \mathcal{E}_{int}, \quad \sigma = K|L$$

$$x_L - x_K = d_{KL} \mathbf{n}_{KL}.$$

If $x \in \sigma$,

$$(\nabla u(x)) \cdot \mathbf{n}_{KL} = \frac{u(x_L) - u(x_K)}{d_{KL}} + \mathcal{O}(h).$$

$$\Rightarrow \bar{F}_{K,\sigma} = \underbrace{-\overline{A(\mu)}|_{\sigma}}_{F_{K,\sigma}(u_h)} \frac{u(x_L) - u(x_K)}{d_{KL}} + \mathcal{O}(h^2)$$

where \bar{A} is the harmonic average: $\bar{A} = \frac{A(x_L)A(x_K)d_{KL}}{A(x_L)d_{K,\sigma} + A(x_K)d_{L,\sigma}}$

We want to find $u_h = (u_K)_{K \in \mathcal{T}} \in \mathbb{R}^{\mathcal{T}}$

Define $u_h \rightarrow F_{K,\sigma}(u_h)$ that approximates the flux and find $u \in \mathbb{R}^{\mathcal{T}}$ such that

$$|K|f_K = \sum_{\sigma \in \mathcal{F}_K} F_{K,\sigma}, \quad \forall K \in \mathcal{T}$$

Case of a boundary edge

$\sigma \in \mathcal{E}_{\text{ext}}$

$$x_\sigma - x_K = d_{K\sigma} \mathbf{n}_{K\sigma}.$$

$$(\nabla u(x)) \cdot \mathbf{n}_{K\sigma} \approx \frac{u(x_\sigma) - u(x_K)}{d_{K\sigma}} = \frac{0 - u(x_K)}{d_{K\sigma}} \quad (\text{boundary condition})$$

$$\implies \bar{F}_{K,\sigma} = \underbrace{-|\sigma|A_K \frac{-u(x_K)}{d_{K\sigma}}}_{F_{K,\sigma}(u_h)} + \mathcal{O}(h^2)$$

Find $u_h = (u_K)_{K \in \mathcal{T}_h}$ such that for all K in \mathcal{T}_h :

$$\sum_{\sigma \in F_K \cap F_{int}} \tau_\sigma (u_K - u_L) + \sum_{\sigma \in F_K \cap F_{ext}} \tau_\sigma u_K = \int_K f(x) dx$$

with Dirichlet boundary $u = 0$ on $\partial\Omega$, where $\tau_\sigma = |\sigma| \frac{A_K A_L}{A_L d_{K,\sigma} + A_K d_{L,\sigma}}$ on F_{int}

and $\tau_\sigma = |\sigma| \frac{A_K}{d_{K,\sigma}}$ on F_{ext}

We take here $\Omega = [0, 1] \times [0, 1]$ with a cartesian mesh.

$$A(x, y; \mu) = 2\mu_1 + \mu_2 \sin(x + y) \cos(xy)$$

$$f(x, y; \mu) = \mu_3(1 - y) + \mu_4 x (1 - x)$$

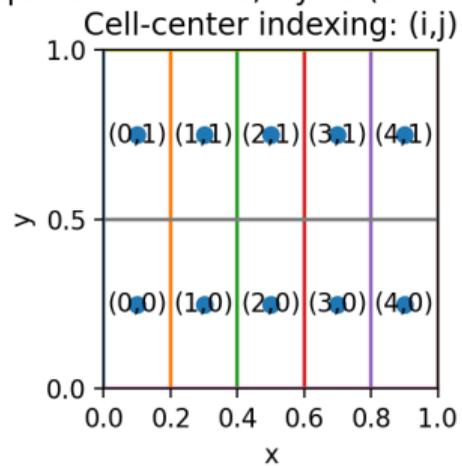

POD-based Reduced Order Model with TPFA

- ◇ Complete the function `assemble_tpfa`. The TPFA solver must return the cell centers, the matrix M , and the vector b such that $Mu = b$.
- ◇ Generate a training dataset:
 - Use $N_{train} = 10$ snapshots and sample random parameters μ with components in $[0, 1]$.
 - Solve the full-order TPFA system for each sampled parameter.
 - Store the resulting solutions as a snapshots list.
- ◇ Using the discrete L^2 inner product $(u, v)_{L^2} = \sum_K |K| u_K v_K$,
 - Assemble the snapshot correlation matrix.
 - Compute the reduced basis with a Proper Orthogonal Decomposition (POD).
 - Verify that the reduced basis is orthonormal with respect to $(\cdot, \cdot)_{L^2}$.
- ◇ Determine how many modes N are sufficient using the Relative Information Content.
- ◇ Write a function that computes the ROM projection coefficients of a given full-order solution u .
- ◇ Consider a new parameter μ . Write a function that computes the reduced-order approximation of the solution without computing the HF solution.
- ◇ Show that the obtained reduced system has the form $\tilde{M}a = \tilde{b}$, where \tilde{M} is of size $N \times N$ and \tilde{b} is of size N .

POD-based Reduced Order Model with TPFA

- ◇ Test the reduced model for $\boldsymbol{\mu} = (0.6, 0.5, 0.2, 0.8)$.
- ◇ Compare the errors $\|u_{\text{ref}} - u\|_{L^2}$ and $\|u_{\text{ref}} - u_N\|_{L^2}$, where u_{ref} is a refined solution.

Unit square with $N_x=5$, $N_y=2$ ($dx=0.2$, $dy=0.5$)

with Kolmogorov n width not small: $u(x, \mu) = \tanh\left(\frac{x-\mu}{\delta}\right)$.

FEM with Kolmogorov n width not small: Burgers equation:
 Viscous Burgers (1D) with periodic BC using scikit-fem

$$\begin{aligned}
 u_t + \nu u \times u_x - \varepsilon u_{xx} &= 0 \text{ in } (0, T] \times [-1, 1] \\
 u(0, x) &= u_0(x) = lam + \sin(x) \\
 u &\text{ periodic at } x = -1 \text{ and } x = 1
 \end{aligned}$$

Time stepping: IMEX (explicit convection, implicit diffusion)

$$(M + dt \varepsilon K)u^{n+1} = Mu^n - dt F(u^n) \text{ where } F_i(u^n) = \int \nu v_i (u^n) (u^n)_x dx$$
